

**COMP 20  
WEB PROGRAMMING**

WEEK 11  
LISA DIORIO  
LISA.DIORIO@TUFTS.EDU

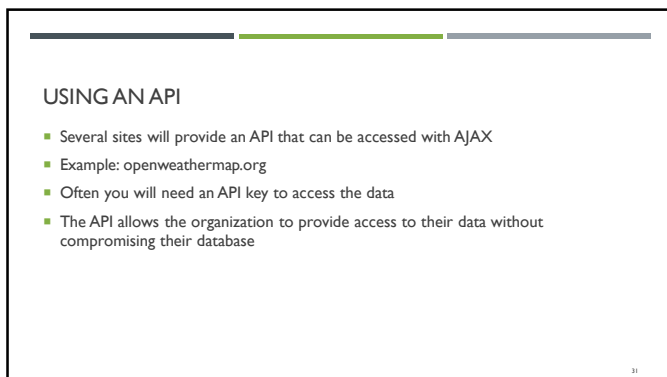

29

**NEW OFFICE HOURS**

Sunday 11am  
Mon 7pm  
Tues 3:30pm  
Thurs 8pm

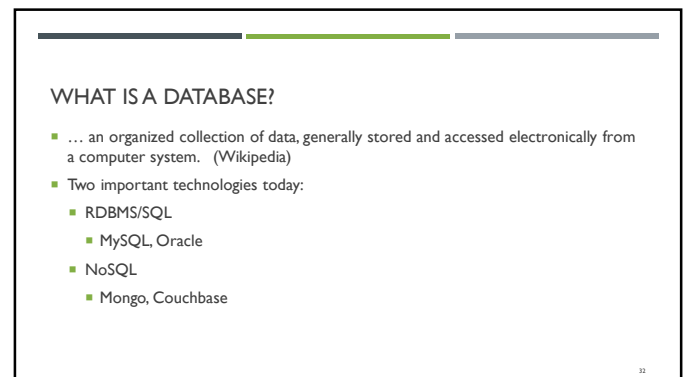

30

**USING AN API**

- Several sites will provide an API that can be accessed with AJAX
- Example: openweathermap.org
- Often you will need an API key to access the data
- The API allows the organization to provide access to their data without compromising their database

31

**WHAT IS A DATABASE?**

- ... an organized collection of data, generally stored and accessed electronically from a computer system. (Wikipedia)
- Two important technologies today:
  - RDBMS/SQL
    - MySQL, Oracle
  - NoSQL
    - Mongo, Couchbase

32

## RDBMS

- Entities are placed in separate units called *tables*
- Reduction of *redundancy*
- *Optimized for size and efficiency* of data
- Query using SQL

33

33

## NOSQL (NOT ONLY SQL)

- Originated in 1998
- Better for massive amount of data
- No schema
- No tables (documents)
- Key value pairs
- No query language

34

34

## RELATIONAL DATABASES AND SQL

35

35

## RELATIONAL DATABASE MODEL

Tables have columns and rows (records)

Columns have a name and a data type

36

36

## PRIMARY KEY – FOREIGN KEY RELATIONSHIPS

37

## EXAMPLE DATABASE: NORTHWIND

38

## SQL: STRUCTURED QUERY LANGUAGE

```
select lastname, region
from employees
```

lastname	region
Davolio	WA
Fuller	WA
Leverling	WA
Peacock	WA
Buchanan	
Suyama	
King	
Callahan	WA
Dodsworth	

```
select lastname, region
from employees
where region='WA'
```

lastname	region
Davolio	WA
Fuller	WA
Leverling	WA
Peacock	WA
Callahan	WA

39

## WORKING WITH MULTIPLE TABLES: JOINS

- Example: Show all products and the company name of the supplier for all products that cost less than \$10

```
select productname, companyname
FROM products INNER JOIN suppliers
ON products.supplierid = suppliers.supplierid
where unitprice < 10
```

SQL Practice: [https://www.w3schools.com/sql/trysql.asp?filename=trysql\\_op\\_in](https://www.w3schools.com/sql/trysql.asp?filename=trysql_op_in)

40

## TRY IT

- Use \* as a wildcard to indicate all columns
- Separate multiple columns with a comma
  - `select * from table1` *show all columns*
  - `select col1, col2 from table1` *show column1 and column2 only*
- The clause ORDER BY specifies the sort column
- *Get the first and last name of employees*
- *Get all product names and their price*
- *Get all product names and their price sorted from highest to lowest price*

41

41

## TRY IT

- The **DISTINCT** modifier limits the results to unique values
  - `select distinct city from employees`
- *List all countries in which there are suppliers – no repeats*
- *How could this be useful?*

42

42

LOGICAL & COMPARISON OPERATORS  
USE WITH WHERE CLAUSE

- = equals
- <> not equals
- < less than
- > greater than
- <= less than or equal
- >= greater than or equal
- `select * from table1 where col1 = 4`

Sometimes you will want to  
apply two or more criteria

In this case use OR or AND to  
combine logical comparisons

`where col1 < 10 or col2 = 'x'`

43

43

## TRY IT

- *Show all products that cost less than \$10*
- *Show all products from Tokyo Traders*

44

44

## SPECIAL CLAUSES

- Checking for Values in a Range
  - Use BETWEEN clause
    - WHERE salary **BETWEEN** 10 **AND** 20
    - WHERE salary **NOT BETWEEN** 10 **AND** 20
- Checking for Missing Values - IS NULL
  - select \* from employees **where region is null**
- IN clause
  - Allows multiple values for value criteria
  - **WHERE state IN** ('ma','ct','vt','me')

45

45

## WORKING WITH DATES

- To reference a date, use quotes
  - select lastName, birthdate from employees
  - where birthdate= '1948-12-11'
- Date functions: month(), day(), year()
  - select lastName, birthdate from employees
  - where year(birthdate)= 1948

46

46

## LIKE CLAUSE

- Allows criteria similar to regular expression
  - % any number of chars
  - \_ any single char
- Example: Get employees whose last names begin with "D"
  - select lastname from employees where lastname **like** 'd%'

47

47

## TRY IT

- Show order details for orders 10250 and 10251
- Display all employees born in Oct through December
- Display all products that begin with the word "Chef"
- Show categories that include "bread" products
- Now show all products that belong to those categories (use the category id)

48

48

### INNER JOIN SYNTAX

- Show all products and the company name of the supplier for all products that cost less than \$10

```
select productname, companyname  
FROM products INNER JOIN suppliers  
ON products.supplierid = suppliers.supplierid  
where unitprice < 10
```

49

49

### TRY IT

- *Show all products from Tokyo Traders*
- *Display orders for companies located in London*

50

50
